Coatings on Vitro Starphire® Glass

Starphire® glass is characterized by its brilliance, clarity, and high light transmittance. These characteristics make Starphire® glass the obvious substrate choice when true color rendition is required of coatings on glass such as ceramic frit or vacuum sputtered coatings.

To avoid transmitted or reflected color mismatch, Vitro Architectural Glass (formerly PPG Industries) recommends that these coatings be consistently applied to the atmosphere (air or top) side of Starphire® glass and not to the tin (bottom) surface of the glass (the surface in contact with the molten tin inside the bath).

The atmospheric and tin surfaces of float glass can be positively identified and differentiated using a small, hand-held short wave ultraviolet lamp (=254 nm; wavelength). Exposure of the tin surface to ultraviolet radiation causes the extremely minute amount of tin on this bottom surface to fluoresce, or glow slightly on reflection. The top surface may exhibit some fluorescence, but the bottom will always show more.

This method of identifying the two surfaces of float glass applies to all float glass, independent of the glass substrate color or manufacturer.

A recommended ultraviolet lamp is the UVG-11 Mineralight® lamp manufactured by UVP, Inc. (Mineralight is a registered trademark of UVP, Inc.). For further information contact:

UVP, Inc.
Upland, CA USA 91786
(800) 452-6788

Caution: Ultraviolet radiation can be damaging to the eyes and skin. Protective shielding may be required. Please contact UVP, Inc., for current product availability and recommended safety practices.
